# Chapter 1

## Overview

Overview of the project

Sunflower Robot is a robot based on the behavior of sunflowers in nature. It will always orient its face in the direction opposite to that of the user. The robot uses Computer Vision technology to detect and track facial movements on camera or webcam and controls servos to move according to those position parameters.

## Chapter 2

# Components

All softwares, library and components which I used for implementing the project.

## 2.1 Softwares

### 2.1.1 Integrated development environment (IDE)

I used Visual Studio Code for development.

Figure 2.1: Visual Studio Code Logo

On VS Code, I installed PlatformIO for scripting and upload code to the Arduino board.

Figure 2.2: PPlatformIO logo

### 2.1.2 Languages

- C++
- Python

### 2.1.3 Frameworks

Arduino framework

### 2.1.4 Libraries

On PPlatformIO, I used Servo library by Michael Margolis at version 1.2.1 for communicate easily with servos.

On Python, I used 2 library:

- pyserial 3.5 for sending face location to serial.
- OpenCV 4.10.0 for detecting human face.

## 2.2 Hardwares

### 2.2.1 Arduino UNO Board

The Arduino UNO is one of the most popular microcontroller boards in the Arduino family. It's designed for beginners and hobbyists to learn electronics and programming. The board is open-source and can be used for a variety of DIY projects and prototypes.

Figure 2.3: Arduino UNO and Adapter

#### Key features:

- Microcontroller: ATmega328P
- Operating Voltage: 5V
- Input Voltage: 7-12V (recommended)
- Digital I/O Pins: 14 (of which 6 can provide PWM output)
- Analog Input Pins: 6
- DC Current per I/O Pin: 20 mA
- Flash Memory: 32 KB (ATmega328P) of which 0.5 KB used by the bootloader
- SRAM: 2 KB (ATmega328P)
- EEPROM: 1 KB (ATmega328P)
- Clock Speed: 16 MHz
- USB Connection: Type B

- Dimensions: 68.6 mm x 53.4 mm

**Pinout:**

- Digital Pins: Used for general-purpose input/output (GPIO).
- Pins 0-13.
- PWM Pins: Digital pins 3, 5, 6, 9, 10, 11 can be used for PWM output.
- Analog Pins: Pins A0-A5 can be used to read analog signals.
- Power Pins: Includes 3.3V, 5V, GND, and Vin.
- Special Pins:
  - Serial: 0 (RX), 1 (TX) for serial communication
  - External Interrupts: 2 and 3
  - SPI: 10 (SS), 11 (MOSI), 12 (MISO), 13 (SCK)
  - I2C: A4 (SDA), A5 (SCL)

You can view more detail about Arduino UNO's datasheet in [here](#).

### 2.2.2 Servo SG90

The SG90 is a micro servo motor that is commonly used for various hobbyist applications due to its compact size, ease of use, and cost-effectiveness. It is capable of rotating 180 degrees (90 degrees in each direction) and can be controlled using a PWM (Pulse Width Modulation) signal.

Figure 2.4: Servo SG90 180°

**Key Features**

- Type: Micro servo
- Weight: 9 grams

- Dimensions: 22.2 mm x 11.8 mm x 31 mm
- Operating Voltage: 4.8V to 6.0V
- Stall Torque:
  - 1.8 kg/cm (at 4.8V)
  - 2.2 kg/cm (at 6.0V)
- Operating Speed: 0.1 s/60 degrees (at 4.8V)
- Temperature Range: -30 to +60 degrees Celsius
- Control System: PWM
- Connector Wire Length: 25 cm
- Gear Type: Plastic

### **Pinout and Wiring**

The SG90 has three wires:

1. Orange (Control Signal): Connect to the PWM signal pin from the microcontroller (e.g., Arduino).
2. Red (Power): Connect to the positive power supply (4.8V to 6.0V).
3. Brown (Ground): Connect to the ground of the power supply and microcontroller.

### **Control**

The SG90 is controlled by sending a PWM signal with specific pulse widths:

- 0 degrees: 1 ms pulse width
- 90 degrees: 1.5 ms pulse width
- 180 degrees: 2 ms pulse width

The frequency of the PWM signal is typically 50 Hz (20 ms period).

You can view more detail about the Servo's data sheet in [here](#).

## Chapter 3

# Scripts

Source Code for this project. You can visit project's repository on github to see detail. In this repository, I created 2 branch:

- **master**: for window user,
- **linux**: for linux user.

## 3.1 Arduino Programming Scripts

In `main.cpp`:

```
1 #include <Arduino.h>
2 #include <Servo.h>
3
4 #define MIN_ANGLE 0
5 #define MAX_ANGLE_SERVO1 80
6 #define MAX_ANGLE_SERVO2 180
7
8 #define FRAME_HEIGHT 480
9 #define FRAME_WIDTH 640
10
11 static uint8_t x_angle = MIN_ANGLE;
12 static uint8_t y_angle = MIN_ANGLE;
13
14 Servo myservo1; //rotate range = [0,80] for up-down
15 Servo myservo2; //rotate range = [0,180] for left-right
16
17 String faceLocation;
18
19 void setup() {
20     Serial.begin(9600);
21
22     myservo1.attach(10);
23     myservo2.attach(9);
24
25     myservo1.write(x_angle);
26     myservo2.write(y_angle);
27
28 }
29
30 void loop() {
31
32     if (Serial.available())
33     {
34         faceLocation = Serial.readStringUntil('\r');
35         // Serial.println("faceLocation");
36         int x_location = faceLocation.substring(0, faceLocation.indexOf(',')).toInt();
37         int y_location = faceLocation.substring(faceLocation.indexOf(',') + 1).toInt();
38
39         y_angle = map(x_location, 0, FRAME_WIDTH, MAX_ANGLE_SERVO2, MIN_ANGLE);
40     }
41 }
```

```
40     x_angle = map(y_location, 0, FRAME_HEIGHT, MIN_ANGLE, MAX_ANGLE_SERVO1
41 );
42     // Serial.println(x_axis);
43     if (x_angle >=0 && x_angle <= MAX_ANGLE_SERVO1)
44     {
45         myservo1.write(x_angle);
46     }
47
48     if(y_angle >= 0 && y_angle <= MAX_ANGLE_SERVO2){
49         myservo2.write(y_angle);
50     }
51
52 }
53
54 }
```

Program 3.1: Programming script for Arduino

## 3.2 Face Detection Scripts Using Python

In FaceDetection.py:

```
1
2 import serial
3 import cv2 as cv
4 # import time
5 from serial.tools import list_ports
6
7 # ports = list(list_ports.comports())
8 # for port in ports:
9 #     print(port.device)
10
11 portName = "/dev/ttyACM0"
12
13 arduinoData = serial.Serial(portName, 9600)
14
15 print(cv.__version__)
16
17 def send_coordinates_to_arduino(x, y, w, h):
18     # Convert the coordinates to a string and send it to Arduino
19     coordinates = f"{x+w/2},{y+h/2}\r"
20     arduinoData.write(coordinates.encode())
21     print(f"X{x+w/2}Y{y+h/2}\n")
22
23 def FaceDetection():
24     # x_rotate = 0
```

```

25     # y_rotate = 0
26
27     capture = cv.VideoCapture(0, cv.CAP_V4L2) #Change the number for the
camera that you are using, 0 is for the internal laptop camera, 1 is
for an external webcam
28     face_cascade = cv.CascadeClassifier(cv.data.harcascades + '
haarcascade_frontalface_default.xml')
29     while True:
30         isTrue, frame = capture.read()
31         # print(len(frame[1]))
32         gray = cv.cvtColor(frame, cv.COLOR_BGR2GRAY)
33         faces = face_cascade.detectMultiScale(gray, 1.05, 8, minSize=
(120,120))
34
35         for (x,y,w,h) in faces:
36             cv.rectangle(frame, (x,y), (x+w, y+h), (0,255,0), 5)
37
38             print(f"x={x}, y={y}, w={w}, h={h}")
39             send_coordinates_to_arduino(x, y, w ,h)
40
41         cv.imshow("Video", frame)
42
43         if cv.waitKey(20) & 0xFF == ord('d'):
44             break
45
46         # send_coordinates_to_arduino(x_rotate, y_rotate ,10 ,10)
47         # x_rotate += 2
48         # y_rotate += 2
49
50         # if(x_rotate > 80):
51         #     x_rotate = 0
52
53         # if(y_rotate > 180):
54         #     y_rotate = 0
55
56         # time.sleep(1)
57         capture.release()
58         cv.destroyAllWindows()
59
60
61 if __name__ == '__main__':
62     FaceDetection()

```

Program 3.2: Programming Script for Face Detection using Python

## Chapter 4

### Demo

You can visit the Project's repository on github to see more code's detail.

You also watch final result video on my youtube channel by clicking [here](#).

Figure 4.1: Sunflower robot

Thank you for paying your time to reading this Sunflower Robot's report.

End.
